Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Social fonA precursor - Fusobacterium nucleatum (ATCC 10953)

NyAlternate names: major outer membrane protein, 40K

C;Species: Fusobacterium nucleatum
A;Variety: ATCC 10953

C;Date: 14-Jul-1995 #sequence_revision 21-Jul-1995 #text_change 08-Oct-1999

C;Accession: 546436, 551508

Mol. Gen. Genet. 244, 104-110, 1994

A;Title: Sequence variability of the 40-kDa outer membrane proteins of Fusobacterium nucleatence number: $46435; MUD:94316187; PMID:8041356
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

hypothetical protein 401 - phage lambda

hypothetical protein 401 - phage lambda

N.Alternate names: orf-401; orf401

C.Species: phage lambda

C.Jacte: 13-Jun-1983 #sequence_revision 13-Jun-1983 #text_change 23-Jul-1999

C.Accession: G43010; D43016; A04389

ABC transporter, ATP-binding protein NMB1919 [imported] - Neisseria meningitidis (strai C;Species: Neisseria meningitidis
C;Species: Neisseria: N.J.; Heidelberg, J.; Jeffries, A.C.; Nelson, K.E.; Eisen, J. Hickey, E.K.; Haft, D.H.; Salzberg, S.L.; White, O.; Pleischmann, R.D.; Dougherty, B.A. ri, H.; Qin, H.; Vamanhevan, J.; Gill, J.; Scarlato, V.; Masignani, V.; Pizza, M. Science 287, 1809-1815, 2000
A;Title: Complete genome sequence of Neisseria meningitidis serogroup B strain MCS8.
A;Reference number: A81000; MUID:20175755; PMID:10710307
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-621 aTET>
A;Experimental source: Serogroup B, strain MCS8

Nucleic Acids Res. 17:1262-1262(1989).

-!- FUNCTION: THIS PROTEIN IS NOT A PROTEASE, BUT IT ACTIVATES

ELSMINGEN BY COMPLEXING WITH IT. AS POTENTIAL VIRULENCE FACTOR,

IT IS THOUGHT TO PREVENT THE FORMATION OF EFFECTIVE FIBRIN

BARRIERS AROUND THE SITE OF INFECTION, THEREBY CONTRIBUTING TO THE

INVASIVENESS OF THE CELLS.
                                                                                                                                                                                                                                                                                                                                                Gaps

-!- FUNCTION: Lysosomal serine protease with tripeptidyl-peptidase I activity. May act as a non-specific lysosomal peptidase which generates tripeptides from the breakdown products produced by lysosomal proteinases. Requires substrates with an unsubstituted N-terminus (By similarity).

-!- CATALYTIC ACTIVITY: Release of an N-terminal tripeptide from a polypeptide, but also endopeptidase activity.
                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

-!- FUNCTION: Lysosomal serine protease with tripeptidyl-peptidase I activity. May act as a non-specific lysosomal peptidase which generates tripeptides from the breakdown products produced by lysosomal proteinases. Requires substrates with an unsubstituted N-terminus (By similarity).

-!- CATALYTIC ACTIVITY: Release of an N-terminal tripeptide from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Blophys. Acta 1384:233-242(1998).

-!- FUNCTION: Lysosomal serine protease with tripeptidyl-peptidase I activity. May act as a non-specific lysosomal peptidase which generates tripeptides from the breakdown products produced by lysosomal proteinases. Requires substrates with an unsubstituted N-terminus. Maximum activity at pH 4, unstable above pH 7.

-!- CATALYTIC ACTIVITY: Release of an N-terminal tripeptide from a
                                                                                                                                                                                                                                Gaps

Handa Papa: not the mother of all lambda phages.",
Science 258:1145-1146 (1992).
-I- MISCELLANEOUS: The common laboratory strain of bacteriophage
lambda; lambda Papa; carries a frameshift mutation relative to Ur-
lambda, the original isolate. The Ur-lambda virions have thin,
jointed tall fibers (side tail fibers) that are absent from lambda
wild type. Relative to lambda PaPa, Ur-lambda has expanded
receptor specificity and adsorbs to E. coll cells more rapidly.
-!- SIMILARITY: BELONGS TO THE TAIL FIBER PAMILY.
-!- CAUTION: THIS IS A CONCEPTUAL TRANSLATION; A FRAMESHIFT WAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Gin+(Ser or Gly) for the enzyme from tobacco etch virus. The natural substrate is the viral polyprotein, but other proteins and oligopeptides containing the appropriate consensus sequence are
                                                                                                                                      (RNA)(N)

(ATALYTIC ACTIVITY: Hydrolyzes a Gly-|-Gly bond at its own C-terminus, commonly in the sequence -Tyr-Xaa-Val-Gly-|-Gly, in the processing of the potyviral polyprotein.

PTM: VPG IS COVALENTLY LINKED TO THE GENOMIC RNA.

PTM: THE VIRAL RNA OF POTYVIRUSES IS EXPRESSED AS A SINGLE POLYPROTEIN WHICH UNDERGOES POSTTRANSLATIONAL PROTEOLYTIC PROCESSING RESULTING IN THE PRODUCTION OF AT LEAST EIGHT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hydrolase; Transferase; Thiol protease; RNA-directed RNA polymerase; Coat protein; Polyprotein; Covalent protein-RNA linkage; Helicase; ATP-binding. 1 529 N-TERMINAL PROTEIN (BY SIMILARITY).

-!- FUNCTION: May regulate transcription of class II genes through association with the RNA polymerase II-SRB complex.
-!- SUBUNIT: Component of an RNA polymerase II-SRB complex.
-!- SUBCELLULAR LOCATION: Nuclear (Probable).
                                                                                                                                                                                                                                                             Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

        CATALYTIC ACTIVITY: 4 porphobilinogen + H(2)0 = hydroxymethylbilane + 4 NH(3).

hydroxymethylbilane + 4 NH(3).

CORACTOR: COVALENTLY BINDS A DIPYRROMETHANE COFACTOR TO WHICH THE PORPHOBILINOGEN SUBUNITS ARE ADDED (BY SIMILARITY).

PATHWAY: PORPHYIN DIGOYNICHEBIS by the C5 pathway; fourth step. SIMILARITY: BELONGS TO THE HMBS FAMILY.
HYDROXYMETHYLBILANE PREUROPORPHYRINOGEN IN SEVERAL DISCRETE STEPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.

-1- PATHWAY: L-arabinose catabolism; first step.
-1- SIMILARITY: Belongs to the arabinose isomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 26; DB 1; Length 496;

Weiss R.B., Dunn D.M., Robb F.T., Brown J.R.;
Where complete sequence of the Pyrococcus furiosus genome.";
Submitted (PEB-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes amidations at positions B. D., E, and G on adenosylcobyrinic A,C-diamide. NH(2) groups are provided by glutamine, and one molecule of ATP is hydrogenolyzed for each amidation (By similarity).
-!- PATHWAY: Cobalamin biosynthesis.
-!- SIMILARITY: BELONGS TO THE COBB/COBQ FAMILY. COBQ SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Thermotoga maritima.

Nabel Manager Strong Function of Wordplasma bovis and Mycoplasma agalactiae Species identification of Mycoplasma bovis and Mycoplasma agalactiae based on the uvrC genes by PCR."

1. FUNCTION: The UvrABC repair system catalyzes the recognition and processing of DNA lesions. UvrC both incises the 5' and 3' sides of the lesion. The N-terminal half is responsible for the 3' incision and the C-terminal half is responsible for the 5' incision (By similarity).

1. SUBUNIT: Interacts with uvrB in an incision complex (By

similarity).
--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
--- SIMILARITY: Belongs to the uvrc family.
--- SIMILARITY: Contains 1 UVR domain.

-!- SUBUNIT: RNA polymerase III consists of about 15 different
subunits. This subunit is the second largest component of RNA
polymerase III (By similarity)
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the RNA polymerase beta chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .,

C CATALYTIC ACTIVITY: ATP + L-phenylalanine + tRNA(Phe) = AMP +

Genome Res. 12:689-700(2002).

C CATALYTIC ACTIVITY: ATP + L-phenylalanine + tRNA(Phe) = AMP +

Genome Res. 12:689-700(2002).

C CATALYTIC SETION: Cytoplasmic.

C CATALYTY: Belongs to the phenylalanyl-tRNA synthetase beta chain

C C CATALYTY: Contains 1 tRNA-binding domain.
                                Thermoanaerobacter tengcongensis.
Bacteria, Firmicutes; Clostridia; Thermoanaerobacteriales; Thermoanaerobacteriaceae; Thermoanaerobacter.
Phenylalanyl-tRNA synthetase beta chain (EC 6.1.1.20) (Phenylalanine--tRNA ligase beta chain) (PheRS).
PHBT OR TTE1689.
